The position monitoring function not only controls the position of the robot but also external movements in up to eight designated areas around the machine. As a result, the robotic arm can adapt its behaviour in real-time on the basis of what is happening in its proximity. For example, the robot can reduce its speed, avoid moving towards the obstacle or stop.

Previously, SafePlus allowed the robot to reduce its speed when operators were present by defining a cubic speed monitoring area with equal x, y and z safety distances, it is now possible to create asymmetrical areas, where the safety distances differ. In fact, objects lying in directions where the robot does not move do not create an obstacle. Therefore, the safe distances in these directions can be minimised, thus safely reducing emergency stop downtime and allowing applications in tighter spaces.

In addition, end users have the flexibility to easily construct and operate safety systems that address their intended applications. Safety monitoring conditions and operating parameters can be configured directly in the robot controller, without the need for specific safety CPUs.

Also, Mitsubishi Electric has increased the number of duplicated safe I/O inputs and outputs available in the system, contributing to the creation of more reliable and flexible safety systems.

Increasing touch sensitivity

Besides the new functionality featured in SafePlus, Mitsubishi Electric has also optimised the safety monitoring and collision detection functions.

The safety measures used by SafePlus are certified by the leading independent and impartial certification body, TÜV SÜD, to ensure compliance with international IEC and EN standards, such as EN 61800-5-2 on safe motion and EN 60204 on safety stop. This third-party testing attests to Mitsubishi Electric's commitment to deliver high-quality, reliable solutions to its customers.

The company also boosted the system's collision detection capabilities by applying AIRSKIN safety pads onto its FR-series robots that integrate with SafePlus. The solution, compliant with ISO 13849 (PLe) and IEC 62061 (SIL3) safety standards, features a soft structure, designed to reduce the impact of the moving robotic arm.

In addition, if safety sensors on the surface of the cover detect any pressure, e.g. due to a collision with an object, different operations can be programmed.

Barry Weller, Product Manager at Mitsubishi Electric, comments: "Mitsubishi Electric's FR-series offers high performance for industrial applications. By combining them with MELFA SafePlus, users can employ these robotic arms for new tasks and use them in more environments

"Our latest safety solution is a big step forward for safe, automated, co-operative work applications. By offering increased flexibility, reliability and ease of use, our technology helps manufacturers to boost their productivity and uptime, even in confined spaces, by promoting a safer and more productive interaction between humans and robots."

About Mitsubishi Electric

With nearly 100 years of experience in providing reliable, high-quality products, Mitsubishi Electric Corporation (TOKYO: 6503) is a recognized world leader in the manufacture, marketing and sales of electrical and electronic equipment used in information processing and communications, space development and satellite communications, consumer electronics, industrial technology, energy, transportation and building equipment. Embracing the spirit of its corporate statement, Changes for the Better, and its environmental statement, Eco Changes, Mitsubishi Electric endeavors to be a global, leading green company, enriching society with technology. The company recorded consolidated group sales of approximately 40.7 billion dollars* in the fiscal year that ended on March 31, 2019.

Mitsubishi Electric Europe, Industrial Automation – UK Branch is located in Hatfield, United Kingdom. It is a part of the European Factory Automation Business Group based in Ratingen, Germany which in turn is part of Mitsubishi Electric Europe B.V., a wholly owned subsidiary of Mitsubishi Electric Corporation, Japan.

The role of Industrial Automation – UK Branch is to manage sales, service and support across its network of local branches and distributors throughout the United Kingdom.
